

Spring semester 2022, students from RHAM Middle School and RHAM High School in grades 7-12 participated in the Youth Voices Count Survey on youth lifestyles, substance use, mental health, bullying and related risk and protective factors. 81% of students responded (981 students).

Alcohol remains the most commonly used substance among youth

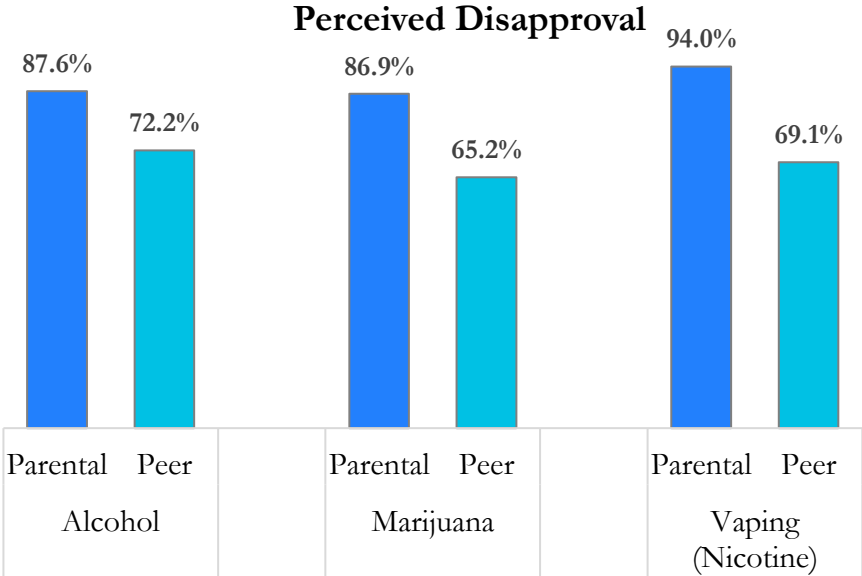

0.9% of AHM youth reported using **synthetic marijuana** in their lifetime and 0.5% report having ever used **heroin/fentanyl** in their lifetime. While these percentages are low, they are of concern because experimentation with these substances can be fatal.

AHM youth who have used **any substance in their lifetime** are more likely to have increased behavioral health concerns including: anxiety, feeling sad or hopeless two weeks in a row or more, having considered suicide in the past year, and feel less comfortable seeking help from adults in their lives.

Risk Factors

Research shows that parents and peers are the leading influence on youths’ decisions on whether to use substances or not. This figure shows the percentage of youth reporting their parents or friends feel it is moderately or greatly wrong to use alcohol, marijuana, or vape nicotine.

The percentage of AHM youth reporting moderate or great risk of harm from:

VAPING NICOTINE

BINGE DRINKING

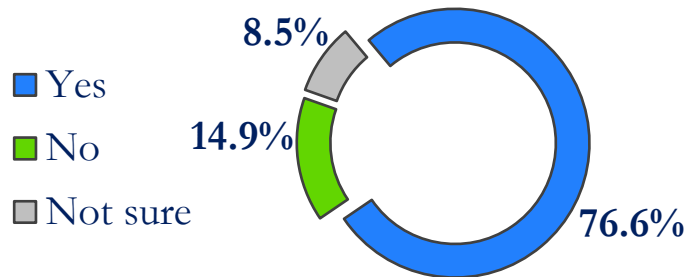

MARIJUANA/ THC

Marijuana ranks **the lowest** for perceived risk among AHM youth.

Perception of Clear Family Rules around Drinking Alcohol

77% of AHM youth (grades 7-12) report clear family rules around alcohol use, compared to 89% around vaping, and 84% around marijuana.

Access

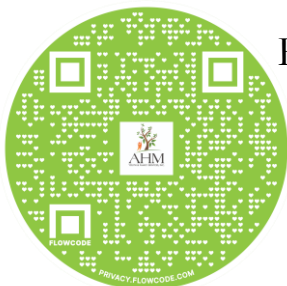

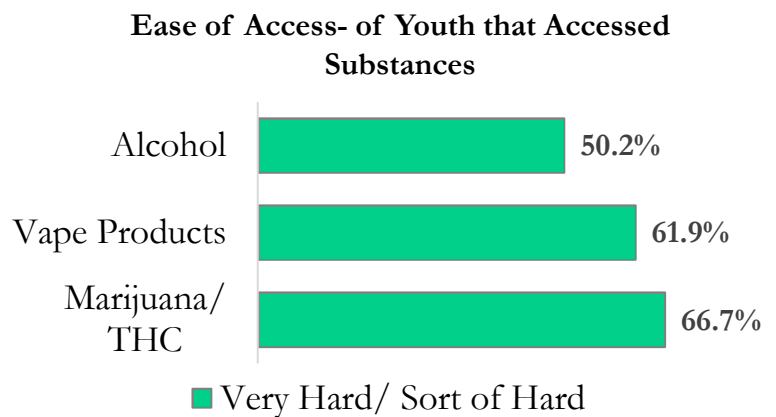

AHM youth reported most frequently accessing **alcohol** and **marijuana** from:

- Friends/peers
- Home without parents' permission

Vape Products from:

- Friends/peers
- Store

Ease of access to substances has been shown to have a significant relationship with youth substance use. The figure below reflects the percentage of youth reporting it is very or sort of hard to access substances.
